We derive some interesting identities and arithmetic properties of Bernoulli and Euler polynomials from the orthogonality of Hermite polynomials. Let $\mathbf{P}_n = \{p(x) \in \mathbb{Q}[x] \mid \deg p(x) \leq n\}$ be the $(n+1)$ -dimensional vector space over \mathbb{Q} . Then we show that $\{H_0(x), H_1(x), \dots, H_n(x)\}$ is a good basis for the space \mathbf{P}_n for our purpose of arithmetical and combinatorial applications.

1. Introduction

As is well known, the Euler polynomials, $E_n(x)$, are defined by the generating function as follows:

$$\frac{2}{e^t + 1} e^{xt} = e^{E(x)t} = \sum_{n=0}^{\infty} E_n(x) \frac{t^n}{n!} \quad (1.1)$$

(see [1–8]), with the usual convention about replacing $E^n(x)$ by $E_n(x)$.

In the special case, $x = 0$, $E_n(0) = E_n$ is called the n th Euler number. From (1.1) and definition of Euler numbers, we note that

$$E_n(x) = (E + x)^n = \sum_{l=0}^n \binom{n}{l} E_l x^{n-l} = \sum_{l=0}^n \binom{n}{l} E_{n-l} x^l \quad (1.2)$$

with the usual convention about replacing E^n by E_n .

The *Bernoulli numbers* are defined as

$$B_0 = 1, \quad (B + 1)^n - B_n = \delta_{1,n} \quad (1.3)$$

(see [9–14]), where $\delta_{k,n}$ is a Kronecker symbol.

As is well known, *Bernoulli polynomials* are also defined by

$$B_n(x) = (B + x)^n = \sum_{l=0}^n \binom{n}{l} B_l x^{n-l} = \sum_{l=0}^n \binom{n}{l} B_{n-l} x^l \quad (1.4)$$

with the usual convention about replacing B^n by B_n (see [1, 15–18]).

The *Hermite polynomials* are defined by the generating function as follows:

$$e^{2xt-t^2} = e^{H(x)t} = \sum_{n=0}^{\infty} H_n(x) \frac{t^n}{n!} \quad (1.5)$$

(see [5, 19]), with the usual convention about replacing $H^n(x)$ by $H_n(x)$.

From (1.5), we can derive the following identities:

$$\begin{aligned} H_n(x) &= \left(\frac{\partial}{\partial t} \right)^n e^{2xt-t^2} \Big|_{t=0} = e^{x^2} \left(\frac{\partial}{\partial t} \right)^n e^{-(x-t)^2} \Big|_{t=0} \\ &= (-1)^n e^{x^2} \left(\frac{\partial}{\partial x} \right)^n e^{-(x-t)^2} \Big|_{t=0} = (-1)^n e^{x^2} \left(\frac{d^n}{dx^n} e^{-x^2} \right). \end{aligned} \quad (1.6)$$

Let us consider two operators as follows:

$$\begin{aligned} f &\mapsto O_1 f = - \left(e^{x^2} \frac{d}{dx} e^{-x^2} \right) f = 2xf - \frac{df}{dx}, \\ f &\mapsto O_2 f = \left(e^{x^2/2} \left(x - \frac{d}{dx} \right) e^{-x^2/2} \right) f = 2xf - \frac{df}{dx}. \end{aligned} \quad (1.7)$$

By (1.7), we get $O_1 = O_2$. In particular, if we take $f = 1$, then we have

$$-e^{x^2} \left(\frac{d}{dx} e^{-x^2} \right) = e^{x^2/2} \left(x - \frac{d}{dx} \right) e^{-x^2/2}. \quad (1.8)$$

We note that

$$(-1)^n e^{x^2} \left(\frac{d^n}{dx^n} e^{-x^2} \right) = \left(-e^{x^2} \frac{d}{dx} e^{-x^2} \right)^n. \quad (1.9)$$

From (1.8), we note that

$$\begin{aligned} (-1)^n e^{x^2} \left(\frac{d^n e^{-x^2}}{dx^n} \right) &= \left(-e^{x^2} \frac{de^{-x^2}}{dx} \right)^n = \left(e^{x^2/2} \left(x - \frac{d}{dx} \right) e^{-x^2/2} \right)^n \\ &= e^{x^2/2} \left(x - \frac{d}{dx} \right)^n e^{-x^2/2}. \end{aligned} \quad (1.10)$$

Thus, by (1.10), we get

$$H_n(x) = e^{x^2/2} \left(x - \frac{d}{dx} \right)^n e^{-x^2/2} \quad (1.11)$$

(see [5, 19–23]). In the special case, $x = 0$, $H_n(0) = H_n$ are called the *Hermite numbers*.

From (1.5), we can derive the following identities:

$$H_n(x) = (H + 2x)^n = \sum_{l=0}^n \binom{n}{l} H_{n-l} 2^l x^l \quad (1.12)$$

(cf. [5, 19]), with the usual convention about replacing H^n by H_n . It is easy to show that

$$\sum_{n=0}^{\infty} H_n \frac{t^n}{n!} = e^{-t^2} = \sum_{l=0}^{\infty} \frac{(-1)^n}{n!} t^{2n}. \quad (1.13)$$

By comparing coefficients on the both sides of (1.13), we get

$$H_{2n} = (-1)^n 2n(2n-1) \cdots (n+1) = \frac{(-1)^n (2n)!}{n!}, \quad H_{2n-1} = 0, \quad (1.14)$$

where $n \in \mathbb{N}$. From (1.12), we have

$$\frac{dH_n(x)}{dx} = 2nH_{n-1}(x) \quad (n \in \mathbb{N}). \quad (1.15)$$

Let $\mathbf{P}_n = \{p \in \mathbb{Q}[x] \mid \deg p(x) \leq n\}$ be the $(n+1)$ -dimensional vector space over \mathbb{Q} . Probably, $\{1, x, x^2, \dots, x^n\}$ is the most natural basis for this space. But $\{H_0(x), H_1(x), H_2(x), \dots, H_n(x)\}$ is also a good basis for the space \mathbf{P}_n , for our purpose of arithmetical and combinatorial applications.

For $p(x) \in \mathbf{P}_n$,

$$p(x) = \sum_{k=0}^n C_k H_k(x), \quad (1.16)$$

for some uniquely determined $b_l \in \mathbb{Q}$.

The purpose of this paper is to develop methods for computing C_k from the information of $p(x)$. By using these methods, we define some interesting identities.

2. Properties of Hermite Polynomials

From (1.5) and (1.13), we note that

$$\begin{aligned}
1 &= \left(\sum_{m=0}^{\infty} \frac{H_m t^m}{m!} \right) \left(\sum_{l=0}^{\infty} \frac{t^{2l}}{l!} \right) \\
&= \left(\sum_{m=0}^{\infty} H_{2m} \frac{t^{2m}}{(2m)!} \right) \left(\sum_{l=0}^{\infty} \frac{(2l)(2l-1)\cdots(l+1)}{(2l)!} t^{2l} \right) \\
&= \sum_{n=0}^{\infty} \left(\sum_{l=0}^n \frac{(2l)(2l-1)\cdots(l+1)}{(2l)!(2n-2l)!} H_{2n-2l} (2n)! \right) \frac{t^{2n}}{(2n)!} \\
&= \sum_{n=0}^{\infty} \left(\sum_{l=0}^n l! \binom{2l}{l} \binom{2n}{2l} H_{2n-2l} \right) \frac{t^{2n}}{(2n)!}.
\end{aligned} \tag{2.1}$$

Thus, by (2.1), we obtain the following recurrence formula.

Proposition 2.1. For $n \in \mathbb{Z}_+ = \mathbb{N} \cup \{0\}$, one has

$$\sum_{l=0}^n l! \binom{2l}{l} \binom{2n}{2l} H_{2n-2l} = \begin{cases} 1, & \text{if } n = 0 \\ 0, & \text{if } n \neq 0 \end{cases}. \tag{2.2}$$

By, (1.5), we get

$$\sum_{n=0}^{\infty} H_n(-x) \frac{t^n}{n!} = e^{2t(-x)-t^2} = e^{2x(-t)-(-t)^2} = \sum_{n=0}^{\infty} H_n(x) (-1)^n \frac{t^n}{n!}. \tag{2.3}$$

From (2.3), we can derive the following reflection symmetric identity of $H_n(x)$:

$$H_n(-x) = (-1)^n H_n(x). \tag{2.4}$$

By (1.5), we easily see that

$$\frac{\partial}{\partial t} \left(e^{2xt-t^2} \right) = (2x - 2t) e^{2xt-t^2}. \tag{2.5}$$

Thus, by (1.5) and (2.5), we get

$$\frac{\partial}{\partial t} \left(\sum_{n=0}^{\infty} H_n(x) \frac{t^n}{n!} \right) = (2x - 2t) \left(\sum_{n=0}^{\infty} H_n(x) \frac{t^n}{n!} \right). \quad (2.6)$$

$$\text{LHS of (2.5)} = \sum_{n=1}^{\infty} H_n(x) \frac{t^{n-1}}{(n-1)!} = \sum_{n=0}^{\infty} H_{n+1}(x) \frac{t^n}{n!}, \quad (2.7)$$

$$\begin{aligned} \text{RHS of (2.5)} &= \sum_{n=0}^{\infty} \left(2xH_n(x) \frac{t^n}{n!} \right) - \sum_{n=0}^{\infty} 2H_n(x) \frac{t^{n+1}}{n!} \\ &= \sum_{n=0}^{\infty} \left(2xH_n(x) \frac{t^n}{n!} \right) - \sum_{n=1}^{\infty} 2H_{n-1}(x) \frac{t^n}{(n-1)!} \\ &= \sum_{n=0}^{\infty} (2xH_n(x)) \frac{t^n}{n!} - \sum_{n=1}^{\infty} 2nH_{n-1}(x) \frac{t^n}{n!}. \end{aligned} \quad (2.8)$$

Thus, by (2.6) and (2.7), we get

$$H_{n+1}(x) = 2xH_n(x) - 2nH_{n-1}(x), \quad (n \in \mathbb{N}). \quad (2.9)$$

From (1.15) and (2.9), we note that

$$H_{n+1}(x) - 2xH_n(x) + H'_n(x) = 0. \quad (2.10)$$

Differentiating on both sides, we have

$$2(n+1)H_n(x) - 2H_n(x) - 2xH'_n(x) + H'_n(x) = 0. \quad (2.11)$$

Thus, we have

$$H''_n(x) - 2xH'_n(x) + 2nH_n(x) = 0. \quad (2.12)$$

From (2.12), we note that $H_n(x)$ is a solution of the following second-order linear differential equation:

$$u'' - 2xu' + 2nu = 0. \quad (2.13)$$

From (1.5), we note that

$$\begin{aligned} \sum_{m=0}^{\infty} H_m(x) \frac{t^m}{m!} &= e^{2tx-t^2} = \left(\sum_{l=0}^{\infty} \frac{(2x)^l}{l!} t^l \right) \left(\sum_{k=0}^{\infty} \frac{(-1)^k}{k!} t^{2k} \right) \\ &= \sum_{n=0}^{\infty} \left(\sum_{k=0}^{\lfloor n/2 \rfloor} \frac{(-1)^k n! (2x)^{n-2k}}{k!(n-2k)!} \right) \frac{t^n}{n!}. \end{aligned} \quad (2.14)$$

Thus, by (2.14), we get

$$\begin{aligned}
 H_n(x) &= \sum_{k=0}^{\lfloor n/2 \rfloor} \frac{(-1)^k n!}{k!(n-2k)!} (2x)^{n-2k} \\
 &= \begin{cases} \sum_{l=0}^{n/2} \frac{(-1)^{n/2-l} n! 2^{2l}}{(n/2-l)!(2l)!} x^{2l}, & \text{if } n \equiv 0 \pmod{2}, \\ \sum_{l=0}^{(n-1)/2} \frac{(-1)^{(n-1)/2-l} n! 2^{2l+1}}{((n-1)/2-l)!(2l+1)!} x^{2l+1}, & \text{if } n \equiv 1 \pmod{2}. \end{cases} \quad (2.15)
 \end{aligned}$$

3. Main Results

By (1.6), we easily get

$$\int_{-\infty}^{\infty} e^{-x^2} H_n(x) H_m(x) dx = (-1)^n \int_{-\infty}^{\infty} \left(\frac{d^n}{dx^n} e^{-x^2} \right) H_m(x) dx. \quad (3.1)$$

From (3.1), we note that

$$\int_{-\infty}^{\infty} e^{-x^2} H_n(x) H_m(x) dx = 2^n n! \sqrt{\pi} \delta_{m,n}. \quad (3.2)$$

It is easy to show that

$$\int_{-\infty}^{\infty} e^{-x^2} x^l dx = \begin{cases} 0 & \text{if } l \equiv 1 \pmod{2}, \\ \frac{l! \sqrt{\pi}}{2^l (l/2)!} & \text{if } l \equiv 0 \pmod{2}, \end{cases} \quad (3.3)$$

where $l \in \mathbb{Z}_+ = \mathbb{N} \cup \{0\}$. By (3.3), we get

$$\int_{-\infty}^{\infty} \left(\frac{d^n e^{-x^2}}{dx^n} \right) x^m dx = \begin{cases} 0 & \text{if } n > m \text{ or } n \leq m \text{ with } n - m \equiv 1 \pmod{2}, \\ \frac{m! (-1)^n \sqrt{\pi}}{2^{m-n} ((m-n)/2)!} & \text{if } n \leq m \text{ with } n - m \equiv 0 \pmod{2}. \end{cases} \quad (3.4)$$

From (3.2), we note that $H_0(x), H_1(x), \dots, H_n(x)$ are orthogonal basis for the space $\mathbb{P}_n = \{p(x) \in \mathbb{Q}[x] \mid \deg p(x) \leq n\}$ with respect to the inner product

$$\langle p(x), q(x) \rangle = \int_{-\infty}^{\infty} e^{-x^2} p(x) q(x) dx. \quad (3.5)$$

For $p(x) \in \mathbb{P}_n$, the polynomial $p(x)$ is given by

$$p(x) = \sum_{k=0}^{\infty} C_k H_k(x), \quad (3.6)$$

where

$$\begin{aligned} C_k &= \frac{1}{2^k k! \sqrt{\pi}} \langle p(x), H_k(x) \rangle \\ &= \frac{(-1)^k}{2^k k! \sqrt{\pi}} \int_{-\infty}^{\infty} \left(\frac{d^k e^{-x^2}}{dx^k} \right) p(x) dx. \end{aligned} \quad (3.7)$$

Let us take $p(x) = x^n \in \mathbb{P}_n$. For $n \equiv 0 \pmod{2}$, we compute C_k in (3.6) as follows

$$\begin{aligned} C_k &= \frac{(-1)^k}{2^k k! \sqrt{\pi}} \int_{-\infty}^{\infty} \left(\frac{d^k e^{-x^2}}{dx^k} \right) x^n dx \\ &= \begin{cases} \frac{(-1)^k}{2^k k! \sqrt{\pi}} \times \frac{(-1)^k n! \sqrt{\pi}}{2^{n-k} ((n-k)/2)!} & \text{if } k \equiv 0 \pmod{2}, \\ 0 & \text{if } k \equiv 1 \pmod{2}. \end{cases} \end{aligned} \quad (3.8)$$

Let $n \equiv 1 \pmod{2}$. Then we have

$$\begin{aligned} C_k &= \frac{(-1)^k}{2^k k! \sqrt{\pi}} \int_{-\infty}^{\infty} \left(\frac{d^k e^{-x^2}}{dx^k} \right) x^n dx \\ &= \begin{cases} \frac{n!}{2^n k! ((n-k)/2)!} & \text{if } k \equiv 1 \pmod{2}, \\ 0 & \text{if } k \equiv 0 \pmod{2}. \end{cases} \end{aligned} \quad (3.9)$$

Therefore, by (3.6), (3.8), and (3.9), we obtain the following proposition.

Proposition 3.1. *One has*

$$\begin{aligned} x^{2n} &= \frac{(2n)!}{2^{2n}} \sum_{k=0}^n \frac{1}{(2k)!(n-k)!} H_{2k}(x), \\ x^{2n+1} &= \frac{(2n+1)!}{2^{2n+1}} \sum_{k=0}^n \frac{1}{(2k+1)!(n-k)!} H_{2k+1}(x). \end{aligned} \quad (3.10)$$

Let us take $p(x) = B_n(x)$. From (3.4), $P(x)$ can be rewritten by

$$B_n(x) = \sum_{k=0}^n C_k H_k(x), \quad (3.11)$$

where

$$C_k = \frac{(-1)^k}{2^k k! \sqrt{\pi}} \int_{-\infty}^{\infty} \left(\frac{d^k e^{-x^2}}{dx^k} \right) B_n(x) dx. \quad (3.12)$$

By integrating by parts, we get

$$\begin{aligned} \int_{-\infty}^{\infty} \left(\frac{d^k e^{-x^2}}{dx^k} \right) B_n(x) &= (-n)(-(n-1)) \cdots (-(n-k+1)) \int_{-\infty}^{\infty} e^{-x^2} B_{n-k}(x) dx \\ &= (-1)^k \frac{n!}{(n-k)!} \sum_{l=0}^{n-k} \binom{n-k}{l} B_{n-k-l} \int_{-\infty}^{\infty} e^{-x^2} x^l dx \\ &= \frac{(-1)^k n!}{(n-k)!} \sum_{\substack{0 \leq l \leq n-k \\ l \equiv 0 \pmod{2}}} \frac{(n-k)! B_{n-k-l}}{l!(n-k-l)!} \times \frac{l! \sqrt{\pi}}{2^l (l/2)!} \\ &= (-1)^k n! \sqrt{\pi} \sum_{\substack{0 \leq l \leq n-k \\ l \equiv 0 \pmod{2}}} \frac{B_{n-k-l}}{(n-k-l)! 2^l (l/2)!}. \end{aligned} \quad (3.13)$$

Thus, from (3.11) and (3.13), we have

$$C_k = \frac{n!}{2^k k!} \sum_{\substack{0 \leq l \leq n-k \\ l \equiv 0 \pmod{2}}} \frac{B_{n-k-l}}{(n-k-l)! 2^l (l/2)!}. \quad (3.14)$$

Therefore, by (3.11) and (3.14), we obtain the following theorem.

Theorem 3.2. For $n \in \mathbb{Z}_+$, one has

$$B_n(x) = n! \sum_{k=0}^n \sum_{\substack{0 \leq l \leq n-k \\ l \equiv 0 \pmod{2}}} \frac{B_{n-k-l}}{2^{k+l} k! (n-k-l)! (l/2)!} H_k(x). \quad (3.15)$$

Remark 3.3. Let us take $p(x) = E_n(x)$. Then, by the same method, we obtain the following identity:

$$E_n(x) = n! \sum_{k=0}^n \sum_{\substack{0 \leq l \leq n-k \\ l \equiv 0 \pmod{2}}} \frac{E_{n-k-l}}{2^{k+l} k! (n-k-l)! (l/2)!} H_k(x). \quad (3.16)$$

Now, we consider $p(x) = H_n(x)$. From (3.6), we note that $p(x)$ can be rewritten as

$$H_n(x) = \sum_{k=0}^n C_k H_k(x), \quad (3.17)$$

where

$$C_k = \frac{(-1)^k}{2^k k! \sqrt{\pi}} \int_{-\infty}^{\infty} \left(\frac{d^k e^{-x^2}}{dx^k} \right) H_n(x) dx. \quad (3.18)$$

By integrating by parts, we get

$$\begin{aligned} \int_{-\infty}^{\infty} \left(\frac{d^k e^{-x^2}}{dx^k} \right) H_n(x) dx &= (-2n) \cdots (-2(n-k+1)) \int_{-\infty}^{\infty} e^{-x^2} H_{n-k}(x) dx \\ &= \frac{(-1)^k 2^k n!}{(n-k)!} \sum_{l=0}^{n-k} \binom{n-k}{l} 2^l H_{n-k-l} \int_{-\infty}^{\infty} e^{-x^2} x^l dx \\ &= \frac{(-1)^k 2^k n!}{(n-k)!} \sum_{\substack{l=0 \\ l \equiv 0 \pmod{2}}}^{n-k} \frac{2^l (n-k)!}{l! (n-k-l)!} H_{n-k-l} \frac{l! \sqrt{\pi}}{2^l (l/2)!} \\ &= (-1)^k 2^k n! \sqrt{\pi} \sum_{\substack{l=0 \\ l \equiv 0 \pmod{2}}}^{n-k} \frac{H_{n-k-l}}{(n-k-l)! (l/2)!}. \end{aligned} \quad (3.19)$$

From (3.17) and (3.19), we note that

$$\begin{aligned} C_k &= \left(\frac{(-1)^k}{2^k k! \sqrt{\pi}} \right) \times \left((-1)^k 2^k n! \sqrt{\pi} \sum_{\substack{0 \leq l \leq n-k \\ l \equiv 0 \pmod{2}}} \frac{H_{n-k-l}}{(n-k-l)! (l/2)!} \right) \\ &= \frac{n!}{k!} \sum_{\substack{0 \leq l \leq n-k \\ l \equiv 0 \pmod{2}}} \frac{H_{n-k-l}}{(n-k-l)! (l/2)!}. \end{aligned} \quad (3.20)$$

Therefore, by (3.17) and (3.20), we obtain the following theorem.

Theorem 3.4. For $n \in \mathbb{Z}_+$, one has

$$H_n(x) = n! \sum_{k=0}^n \sum_{\substack{0 \leq l \leq n-k \\ l \equiv 0 \pmod{2}}} \frac{H_{n-k-l}}{k! (n-k-l)! (l/2)!} H_k(x). \quad (3.21)$$

From Theorem 3.4, we note that

$$H_n(x) = n! \sum_{k=0}^{n-1} \sum_{\substack{0 \leq l \leq n-k \\ l \equiv 0 \pmod{2}}} \frac{H_{n-k-l}}{k! (n-k-l)! (l/2)!} H_k(x) + \frac{n! H_n(x)}{n!}. \quad (3.22)$$

Thus, we have, for $0 \leq k \leq n - k$,

$$\sum_{\substack{0 \leq l \leq n-k \\ l \equiv 0 \pmod{2}}} \frac{H_{n-k-l}}{(n-k-l)!(l/2)!} = 0. \quad (3.23)$$

Let $l, k \in \mathbb{Z}_+$ with $k \leq l$. Then we easily see that

$$\int_{-\infty}^{\infty} \left(\frac{d^k e^{-x^2}}{dx^k} \right) B_l(x) dx = (-1)^k l! \sqrt{\pi} \sum_{\substack{0 \leq j \leq l-k \\ j \equiv 0 \pmod{2}}} \frac{B_{l-k-j}}{(l-k-j)! 2^j (j/2)!}, \quad (3.24)$$

$$\int_{-\infty}^{\infty} \left(\frac{d^k e^{-x^2}}{dx^k} \right) E_l(x) dx = (-1)^k l! \sqrt{\pi} \sum_{\substack{0 \leq j \leq l-k \\ j \equiv 0 \pmod{2}}} \frac{E_{l-k-j}}{(l-k-j)! 2^j (j/2)!}. \quad (3.25)$$

Let us consider the following polynomial of degree n in \mathbb{P}_n :

$$p(x) = \sum_{k=0}^n B_k(x) B_{n-k}(x). \quad (3.26)$$

From (3.6), we note that $p(x)$ can be rewritten as

$$p(x) = \sum_{k=0}^n C_k H_k(x), \quad (3.27)$$

where

$$C_k = \frac{(-1)^k}{2^k k! \sqrt{\pi}} \int_{-\infty}^{\infty} \left(\frac{d^k e^{-x^2}}{dx^k} \right) p(x) dx. \quad (3.28)$$

In [15], it is known that

$$\begin{aligned} p(x) &= \sum_{k=0}^n B_k(x) B_{n-k}(x) \\ &= \frac{2}{n+2} \sum_{l=0}^{n-2} \binom{n+2}{l} B_{n-l} B_l(x) + (n+1) B_n(x). \end{aligned} \quad (3.29)$$

From (3.23) and (3.29), we have the following:

$$C_k = \frac{(-1)^k}{2^k k! \sqrt{\pi}} \left\{ \frac{2}{n+2} \sum_{l=0}^{n-2} \binom{n+2}{l} \int_{-\infty}^{\infty} \left(\frac{d^k e^{-x^2}}{dx^k} \right) B_l(x) dx + (n+1) \int_{-\infty}^{\infty} \left(\frac{d^k e^{-x^2}}{dx^k} \right) B_n(x) dx \right\}, \quad (3.30)$$

By (3.24) and (3.30), we get

$$\begin{aligned}
 C_n &= \left(\frac{(-1)^n}{2^n n! \sqrt{\pi}} \right) \times (n+1) \int_{-\infty}^{\infty} \left(\frac{d^n e^{-x^2}}{dx^n} \right) B_n(x) dx \\
 &= \left(\frac{(-1)^n}{2^n n! \sqrt{\pi}} \right) \times \left((n+1) \frac{(-1)^n n! \sqrt{\pi} B_0}{0! 2^0 0!} \right) = \frac{n+1}{2^n}, \\
 C_{n-1} &= \left(\frac{(-1)^{n-1}}{2^{n-1} (n-1)! \sqrt{\pi}} \right) \times \left((n+1) \int_{-\infty}^{\infty} \left(\frac{d^{n-1} e^{-x^2}}{dx^{n-1}} \right) B_n(x) dx \right) \\
 &= \left(\frac{(-1)^{n-1}}{2^{n-1} (n-1)! \sqrt{\pi}} \right) \times \left((n+1) (-1)^{n-1} n! \sqrt{\pi} \sum_{\substack{j=0 \\ j \equiv 0 \pmod{2}}}^1 \frac{B_{1-j}}{(1-j)! 2^j (j/2)!} \right) \\
 &= \left(\frac{(-1)^{n-1}}{2^{n-1} (n-1)! \sqrt{\pi}} \right) \times \left((n+1) (-1)^{n-1} n! \sqrt{\pi} B_1 \right) = \frac{-n(n+1)}{2^n}.
 \end{aligned} \tag{3.31}$$

For $0 \leq k \leq n-2$, we have

$$\begin{aligned}
 C_k &= \frac{(-1)^k}{2^k k! \sqrt{\pi}} \left\{ \frac{2}{n+2} \sum_{l=k}^{n-2} \binom{n+2}{l} B_{n-l} \int_{-\infty}^{\infty} \left(\frac{d^k e^{-x^2}}{dx^k} \right) B_l(x) dx + (n+1) \int_{-\infty}^{\infty} \left(\frac{d^k e^{-x^2}}{dx^k} \right) B_n(x) dx \right\} \\
 &= \frac{(-1)^k}{2^k k! \sqrt{\pi}} \left\{ \frac{2}{n+2} \sum_{l=k}^{n-2} \binom{n+2}{l} B_{n-l} (-1)^k l! \sqrt{\pi} \times \sum_{\substack{0 \leq j \leq l-k \\ j \equiv 0 \pmod{2}}} \frac{B_{l-k-j}}{(l-k-j)! 2^j (j/2)!} \right. \\
 &\quad \left. + (n+1) (-1)^k n! \sqrt{\pi} \sum_{\substack{0 \leq j \leq n-k \\ j \equiv 0 \pmod{2}}} \frac{B_{n-k-j}}{(n-k-j)! 2^j (j/2)!} \right\} \\
 &= \frac{2}{n+2} \sum_{l=k}^{n-2} \sum_{\substack{0 \leq j \leq l-k \\ j \equiv 0 \pmod{2}}} \binom{n+2}{l} \frac{B_{n-l} B_{l-k-j}!}{2^{k+j} k! (l-k-j)! (j/2)!} \\
 &\quad + (n+1)! \sum_{\substack{0 \leq j \leq n-k \\ j \equiv 0 \pmod{2}}} \frac{B_{n-k-j}}{k! (n-k-j)! (j/2)! 2^{k+j}}.
 \end{aligned} \tag{3.32}$$

Therefore, by (3.27) and (3.32), we obtain the following theorem.

Theorem 3.5. For $n \in \mathbb{Z}_+$, one has

$$\begin{aligned} & \sum_{k=0}^n B_k(x) B_{n-k}(x) \\ &= \sum_{k=0}^{n-2} \left\{ \frac{2}{n+2} \sum_{l=k}^{n-2} \sum_{\substack{0 \leq j \leq n-k \\ j \equiv 0 \pmod{2}}} \binom{n+2}{l} \frac{l! B_{n-l} B_{l-k-j}}{2^{k+j} k! (l-k-j)! (j/2)!} \right. \\ & \quad \left. + (n+1)! \sum_{\substack{0 \leq j \leq n-k \\ j \equiv 0 \pmod{2}}} \frac{B_{n-k-j}}{2^{k+j} k! (n-k-j)! (j/2)!} \right\} H_k(x) \\ & \quad - \frac{n(n+1)}{2^n} H_{n-1}(x) + \frac{n+1}{2^n} H_n(x). \end{aligned} \tag{3.33}$$
